

Michael Demos

HW #5

STAT501

3/22/17

1. A. (too many rolls to fit each one reasonably on page)
 - i.

- ii. Average of 100 sample means: 3.48
Standard deviation of 100 sample means: 1.257
The empirical distribution is approximately normal. This compares well with the theoretical distribution, which is normal.

B. iii. (next page)

- iv. Average of 100 sample means: 3.496
 Standard deviation of 100 sample means: 0.5756
 The empirical distribution is approximately normal, compliant with the normal theoretical distribution.

C. The results from part A and part B differ in that in part A, we had a smaller sample size (2) for each average, and in part B, we had a larger sample size (10) for each average. Therefore, the histogram of the empirical distribution of \bar{x} is closer to resembling the theoretical distribution. The results from part A and part B are similar in that both empirical distribution histograms appear approximately normal.
